

Attention Deficit Disorder (ADD) or Hyperactivity Disorder (HD)

ADD/HD is a neurobiological disorder characterized by persistent problems in three areas: inattention, hyperactivity, and impulsivity. It is estimated to affect 6-9% of school age children. Although it seems more frequent in boys, girls are affected, too. Boys are recognized as having ADHD more often because they tend to be overtly overactive and impulsive while girls tend towards the less obvious inattentive sub-type.

Although there is often improvement as the child matures, many persons with ADD/HD continue to have symptoms into adulthood. Some persons with ADD/HD also have other (*co-morbid*) psychiatric disorders such as mood (*depression*) and anxiety disorders, conduct disorder, oppositional defiant disorder, Tourette's syndrome, and learning difficulties. Low self-esteem is common and early intervention is important to minimize its impact on the child's life.

Treatment of ADD/HD is usually with a stimulant, such as Ritalin, which is effective in most cases. Often, behavioral intervention is added to boost therapeutic success.
